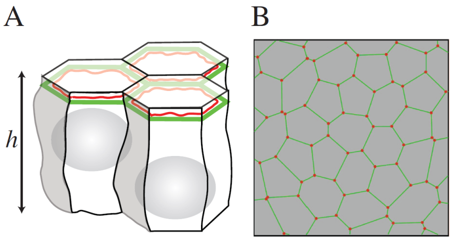
Robustness of epithelia tissue growth to cell mechanics

Charles N. de Santana,
Institute of Evolutionary Biology and Environmental Studies, UZH.

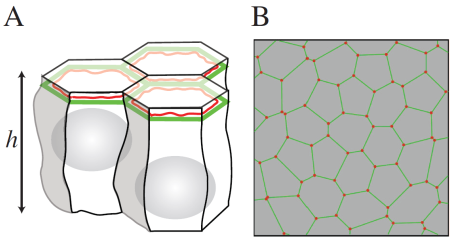
Robustness of epithelia tissue growth to cell mechanics,
22 October 2015, IEU/UZH, Switzerland.

Junctional network



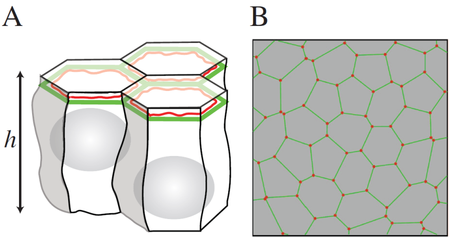
1. Epithelia cells are connected to each other via adhesive molecules (*Cadherin*, and components of the *actin cytoskeleton*) near their apical region.

Junctional network



1. Epithelia cells are connected to each other via adhesive molecules (*Cadherin*, and components of the *actin cytoskeleton*) near their apical region.
2. These apical junctions can be considered as a two-dimensional network (**junctional adherent network**) that defines the cell packing geometry.

Junctional network

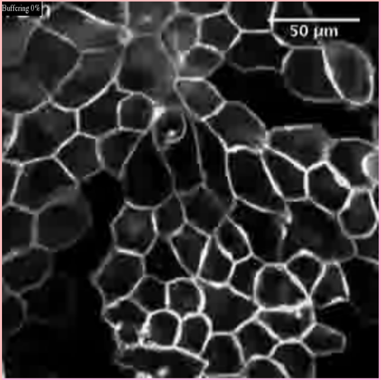


1. Epithelia cells are connected to each other via adhesive molecules (*Cadherin*, and components of the *actin cytoskeleton*) near their apical region.
2. These apical junctions can be considered as a two-dimensional network (**junctional adherent network**) that defines the cell packing geometry.
3. This 2 dimensional

Tissue growth: cells as polygons, tissues as networks[1]

[1] Canine kidney cells (videl kindly offered by Anastasia Trushko (UNIGE))

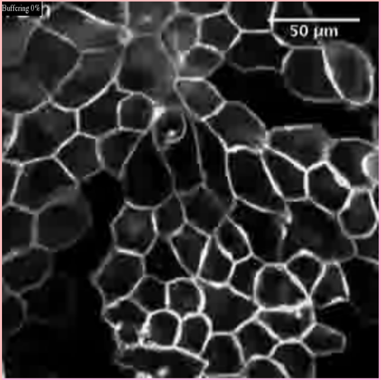
Tissue, cells, Edges, and Vertices



1. Tissue as a network of cells[1].

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

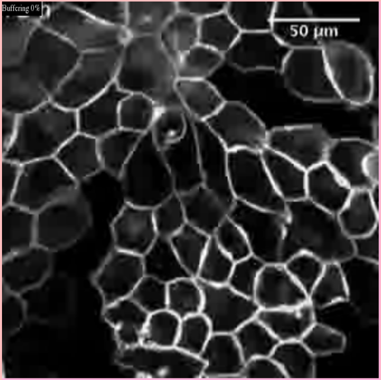
Tissue, cells, Edges, and Vertices



1. Tissue as a network of cells[1].
2. Cells as polygons[1].

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

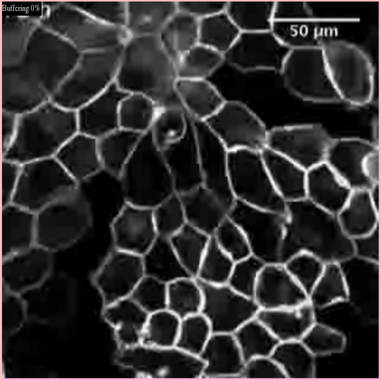
Tissue, cells, Edges, and Vertices



1. Tissue as a network of cells[1].
2. Cells as polygons[1].
3. Each 2 Cells share 1 Edge[1].

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

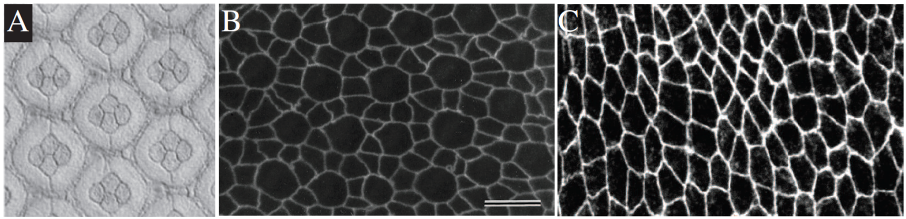
Tissue, cells, Edges, and Vertices



1. Tissue as a network of cells[1].
2. Cells as polygons[1].
3. Each 2 Cells share 1 Edge[1].
4. Each Edge is composed by 2 Vertices[1].

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

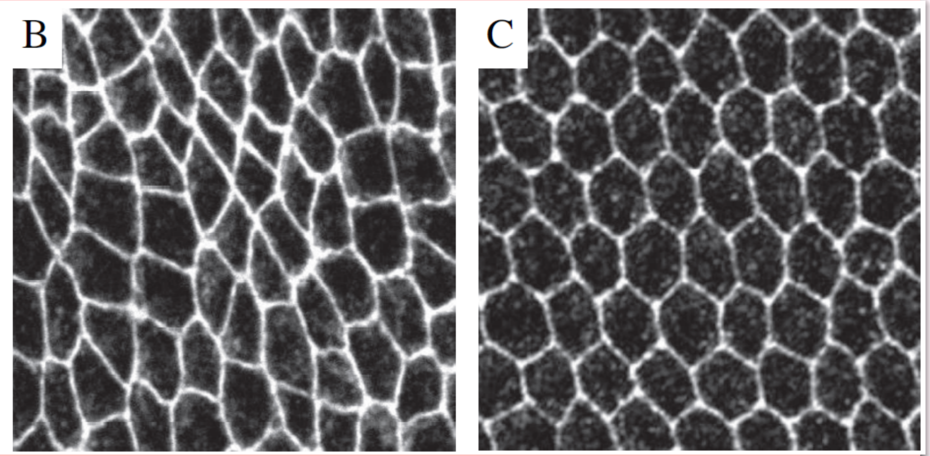
Cell shapes and Different kind of tissues



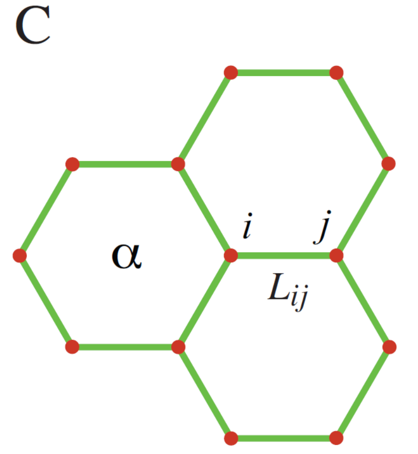
1. A - Drosophila retina ommatidium (eys of a fruit fly)
2. B - Basilar papilla of chicken embryo
3. **C - Drosophila wing disc**

Cell shapes and Different Developmental stages (Drosophila wings)

(B) pupal stage **(C)** before hair formation



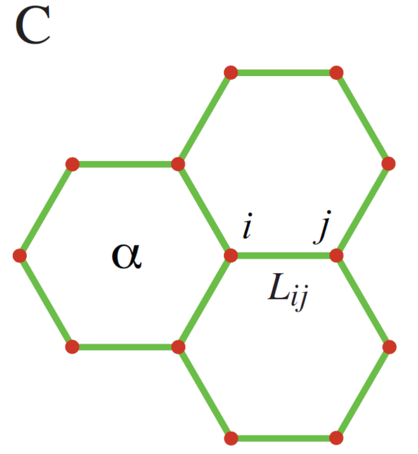
Line Tension, Contractility, and Elasticity



- Edge's Line tension (Λ) is associated to Edge's length[1].

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

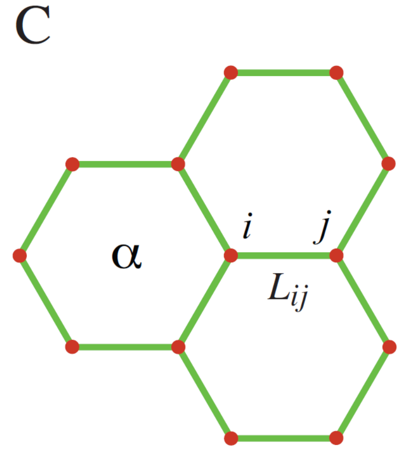
Line Tension, Contractility, and Elasticity



- Edge's Line tension (Λ) is associated to Edge's length[1].
- Cell's Contractility (Γ) is associated to Cell's Perimeter[1].

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

Line Tension, Contractility, and Elasticity



- Edge's Line tension (Λ) is associated to Edge's length[1].
- Cell's Contractility (Γ) is associated to Cell's Perimeter[1].
- Cell's Elasticity (K) is associated to Cell's Area[1].

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

Force Balance Energy Function[1]

$$F = \sum_\alpha \frac{K_\alpha}{2}(A_\alpha - A_\alpha^{(0)})^2 + \sum_{(i,j)} \Lambda_{ij} L_{ij} + \sum_\alpha \frac{\Gamma_\alpha}{2} L_\alpha^2$$

- Elasticity and Cell Area (K_α, and A_α)

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

Force Balance Energy Function[1]

$$F = \sum_\alpha \frac{K_\alpha}{2}(A_\alpha - A_\alpha^{(0)})^2 + \sum_{(i,j)} \Lambda_{ij} L_{ij} + \sum_\alpha \frac{\Gamma_\alpha}{2} L_\alpha^2$$

- Elasticity and Cell Area (K_α, and A_α)
- Line tension and Edge length (Λ_{ij}, and L_{ij})

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

Force Balance Energy Function[1]

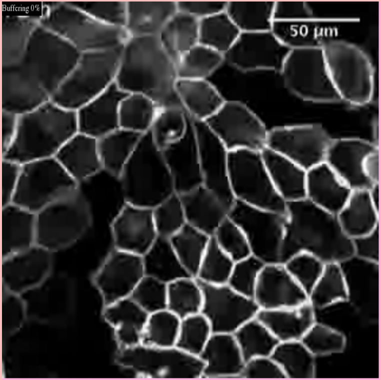
$$F = \sum_\alpha \frac{K_\alpha}{2}(A_\alpha - A_\alpha^{(0)})^2 + \sum_{(i,j)} \Lambda_{ij} L_{ij} + \sum_\alpha \frac{\Gamma_\alpha}{2} L_\alpha^2$$

- Elasticity and Cell Area (K_α, and A_α)
- Line tension and Edge length (Λ_{ij}, and L_{ij})
- Contractility and Cell Perimeter (Γ_α, and L_α)

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

Force Balance Energy Function[1]

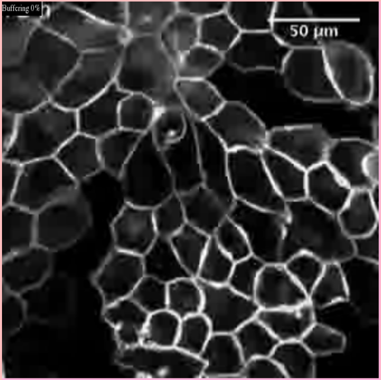
$$F = \sum_\alpha \frac{K_\alpha}{2}(A_\alpha - A_\alpha^{(0)})^2 + \sum_{(i,j)} \Lambda_{ij} L_{ij} + \sum_\alpha \frac{\Gamma_\alpha}{2} L_\alpha^2$$



The physical properties of the cells are static. So, in order to satisfy the **Minimal Energy's Assumption** the positions of the vertices change for different combination of parameters and different events (like the appearance of new cells).

Preferred Cell's Area $A_\alpha^{(0)}$ [1]

$$F = \sum_\alpha \frac{K_\alpha}{2}(A_\alpha - A_\alpha^{(0)})^2 + \sum_{(i,j)} \Lambda_{ij} L_{ij} + \sum_\alpha \frac{\Gamma_\alpha}{2} L_\alpha^2$$



$A_\alpha^{(0)}$ is the preferred area of cell α which is related to the volume, V_α and height, h_α of the cell: $A_\alpha^{(0)} = \frac{V_\alpha}{h_\alpha}$

Robustness question

How do mechanical properties of cells (Cells elasticity, Cells contractility, Edges line tension) affect the growth of tissues?

Strategy to answer the question

To explore a broad range of mechanical parameters (at high resolution) and study the effects of such parameters in the characteristics (**Phenotype**) of simulated cells and tissues.

Potential phenotypes to study:

- Cells shape distribution.

Strategy to answer the question

To explore a broad range of mechanical parameters (at high resolution) and study the effects of such parameters in the characteristics (**Phenotype**) of simulated cells and tissues.

Potential phenotypes to study:

- Cells shape distribution.
- Cells area distribution.

Strategy to answer the question

To explore a broad range of mechanical parameters (at high resolution) and study the effects of such parameters in the characteristics (**Phenotype**) of simulated cells and tissues.

Potential phenotypes to study:

- Cells shape distribution.
- Cells area distribution.
- Cells perimeter distribution.

Strategy to answer the question

To explore a broad range of mechanical parameters (at high resolution) and study the effects of such parameters in the characteristics (**Phenotype**) of simulated cells and tissues.

Potential phenotypes to study:

- Cells shape distribution.
- Cells area distribution.
- Cells perimeter distribution.
- Cells *regularity* distribution.

Strategy to answer the question

To explore a broad range of mechanical parameters (at high resolution) and study the effects of such parameters in the characteristics (**Phenotype**) of simulated cells and tissues.

Potential phenotypes to study:

- Cells shape distribution.
- Cells area distribution.
- Cells perimeter distribution.
- Cells *regularity* distribution.
- Edges angle distribution.

Sequence of Events[1]

1 - Relaxation
Vertices change their position to guarantee the force balance to be equal to zero.

2 - Cell Proliferation
cells growth and cells division.

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing*. Current Biology 17.24 (2007): 2095-2104.

Initial conditions and constrains

1. Rectangular tissue with regular hexagonal cells (all the edges of the cells have the same length).

Initial conditions and constrains

1. Rectangular tissue with regular hexagonal cells (all the edges of the cells have the same length).
2. Non-boundary periodic conditions (the tissue is not *infinite*).

Initial conditions and constrains

1. Rectangular tissue with regular hexagonal cells (all the edges of the cells have the same length).
2. Non-boundary periodic conditions (the tissue is not *infinite*).
3. Line tension of boundary cells (Λ_b) is half the value of the other cells[1].

Relaxation[1]

- 1 - Vertices change their position to guarantee the force balance equal to zero.

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

Relaxation[1]

- 2 - The position of the vertices is defined by a *Verlet Function* in which the accelleration is defined by the total force on the junctions of the tissue.

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

Relaxation[1]

- 3 - Once the force is zero, the accelleration of the *Verlet Function* is also zero, and so the position of the vertices don't change from time step t to $t + \Delta t$.

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

Relaxation

- 4 - Relaxation is finished once the length of the tissue remains *steady* (the position of its vertices don't change) along 100 time steps ($\frac{sd(\sum_{\alpha} L_{\alpha})}{mean(\sum_{\alpha} L_{\alpha})} \approx 0$).

Regularness of the tissue

1. We define ***regularity*** as a dimensionless measure to say how regular the cells of a tissue are.

Regularness of the tissue

1. We define ***regularity*** as a dimensionless measure to say how regular the cells of a tissue are.
2. Regularness is defined as: $Reg = \frac{sd(L_{ij})}{mean(L_{ij})}$ accross all the edges.

Regularness of the tissue

We define ***regularity*** as a dimensionless measure to say how regular the cells of a tissue are.

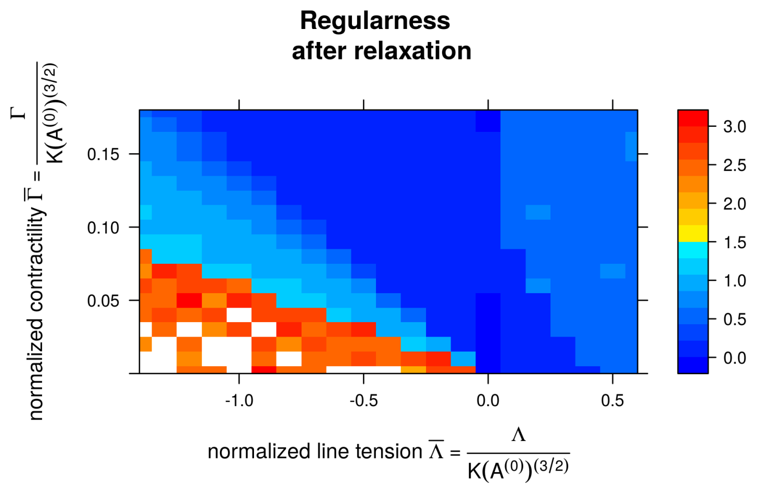
$Reg \approx 0$

$(Lambda, Gamma) = (0, 0.15)$

$Reg > 0$

$(-0.6, 0.08)$

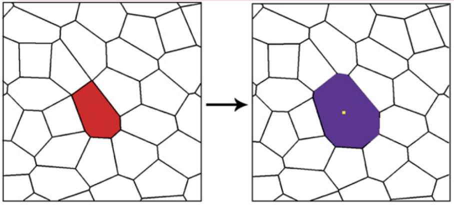
Phase space of Regularness



Cell Proliferation

- Cell Growth.
- Cell Division.

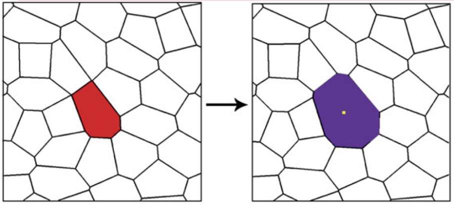
Cell Growth[1]



1. Cells are **randomly** triggered to increase their area.

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

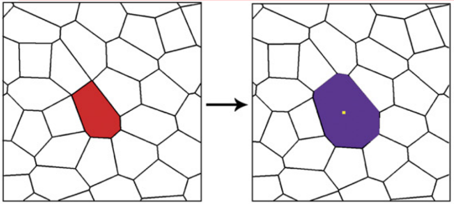
Cell Growth[1]



1. Cells are **randomly** triggered to increase their area.
2. They increase their area by 10% each time step.

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

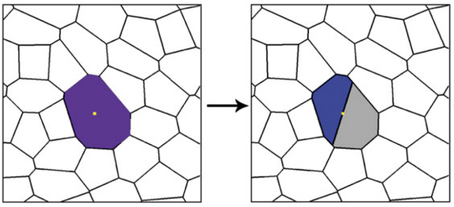
Cell Growth[1]



1. The increment of the area is given by changing the value of the preferred area parameter $(A_\alpha^{(0)})$ on the Force balance equation.

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

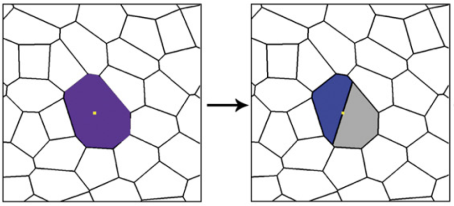
Cell Division[1]



1. Once a cell α reaches the **double** of the area it had **before starting to increase**, it is subdivided into two cells with half the current area of cell α.

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

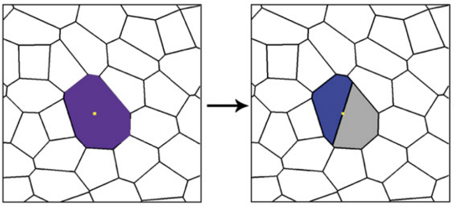
Cell Division[1]



1. The division consists in creating a new edge e_i that **crosses the centroid** of the original cell α with a **random direction.**

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

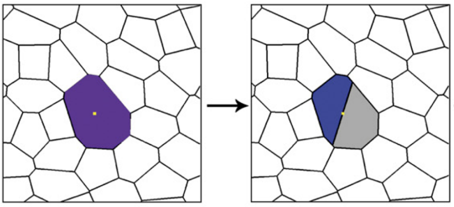
Cell Division[1]



1. The former cell α is replaced by two new cells that share the edge e_i.

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

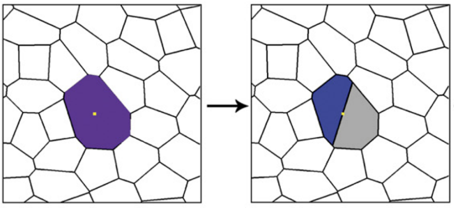
Cell Division[1]



1. Edges in neighbour cells that are now connected to one of the vertices of e_i need to be splitted into two edges.

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

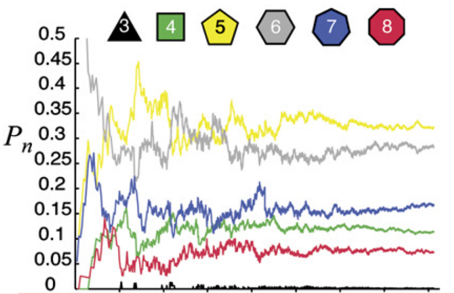
Cell Division[1]



1. This procedure changes the *shape* of the cells in the neighbourhood of α, as well as it creates new cells to replace α that not necessarily have the same *shape* as α.

[1] Farhadifar et al. *The influence of cell mechanics, cell-cell interactions, and proliferation on epithelial packing.* Current Biology 17.24 (2007): 2095-2104.

Steady state



1. The steady state of the cell division proccess is observed once the relative proportion of cells don't change along 100 time steps.

Change in shapes distribution

$Reg \approx 0$

$(Lambda, Gamma) = (0, 0.15)$

$Reg > 0$

$(-0.6, 0.08)$
